

Most public companies place their annual reports on WWW pages in the form of long and static PDF documents. However, this format is intended for printing rather than online browsing. **The ideal solution for that purpose is conversion** of a PDF document into the form of a dynamic document which would also create a kind of alternative to expensive, fully HTML versions of annual reports.

Dynamic documents enable the user to search for some separate phrases. This is a **very convenient way** of looking through certain parts of an annual report. These kind of documents also offer many other useful functions.

A converted file would possess **all functions** typical for a dynamic document which you are using right now.
